Opuntia is original text typeface coming from a phenomenon rather than some historical origin.

This is not a cover, nor revival. This is *NEW TYPEFACE*, for present times. Opuntia is an example of so called genre – Latin of Present.

For long time, I've been dealing with the question of where is the border between old and new look of typefaces made today. Why is so, that some revivals or remixes look much cooler and fresh than those fonts with no spefici historic origin.

The main inspiration behind this typeface is my vision of the "ideal" text font, which stems from years of inspiration and exploration, or rather, from sketching ideal forms. I had long dreamed of a typeface like Opuntia. Looking back, I sketched these ideal shapes in various alphabets (Rino, Món or Liana), to which I repeatedly returned while working on Opuntia.

The typeface is uniquely suited for use in both body text and headlines/display formats. In practice, this meant that I adjusted the typeface for readability at small sizes while taking into account the prominence of details for headline sizes on a cover. And then, naturally, the reverse. Over and over and over and ... I emphasized the details that serve as anchor points for legibility and highlighted them to achieve the character of the Opuntia typeface. One of these defining characteristics is, for example, the weight and stroke quality of the typeface. In any other typeface family, the Book weight would fall somewhere between Medium and Semibold. I choose the Book weight as standard weight. Maybe in future, I will revisit this project and complete the full family of weights: Thin–Black both for upright and italic.

The project and this specimen is presented on various texts. Mainly music references and other culture events. Aside from that, Opuntia is presented on pro-Palestine and pro-liberation, Intifada, claims to condemn the ongoing genocide by illegal state of Israel against Palestinian people. The illegal occupation that is ongoing from 1947 till today.

Opuntia is one of many symbols of Palestine and the name came naturally while working on the typeface.

The specimen comes with B2 poster, so you can put the Opuntia sonewhere.

Opuntia Book + Italic

Opuntia, commonly called the prickly pear cactus, is a genus of flowering plants in the cactus family Cactaceae, many known for their flavorful fruit and showy flowers. Cacti are native to the Americas, and are well adapted to arid climates; however, they are still vulnerable to alterations in precipitation and temperature driven by climate change. The plant has been introduced to Australia, southern Europe, the Middle East, and parts of Africa.

Prickly pear alone is also used to refer to the fruit, but may also be used for the plant itself; in addition, other names given to the plant and its specific parts include tuna (fruit), sabra, sabbar, nopal (pads, plural nopales, from the Nahuatl word nōpalli), nostle (fruit) from the Nahuatl word nōchtli, and paddle cactus. The genus is named for the Ancient Greek city of Opus. The fruit and leaves are edible. The most common culinary species is the "Barbary fig" (Opuntia ficus-indica).

The prickly pear is also considered a national symbol of Palestine, having been grown across historic Palestine for centuries, traditionally being used to mark out land boundaries. The plant is seen by Palestinians as representing qualities of resilience and patience, as represented by the Palestinian proverb saber as-sabbar ("the patience of the cactus"). Its use as an emblem of Palestine has been traced to a painting produced by the artist Zulfa al-Sa'di in the 1930s. Its visibility was renewed by historical research carried out in the 1980s and 1990s on the Nakba, which revealed that many destroyed Palestinian villages subsequently saw regrowth of the cacti. The plant's ability to thrive anywhere is also considered to reflect the experiences of the Palestinian diaspora.

In places where they have been introduced outside their native range, some species in the genus Opuntia behave as aggressive invasive species.

Like most true cactus species, prickly pears are native only to the Americas. Through human action, they have since been introduced to many other areas of the world. Prickly pear species are found in abundance in Mexico, especially in the central and western regions, and in the Caribbean islands (West Indies). In the United States, prickly pears are native to many areas of the arid, semi-arid, and drought-prone Western and South Central United States, including the lower elevations of the Rocky Mountains and southern Great Plains, where species such as O. phaeacantha and O. polyacantha have become dominant, and to the desert Southwest, where several types are endemic. Prickly pear cactus is also native to sandy coastal beach scrub environments of the East Coast from Florida to southern Connecticut, where O. humifusa, O. stricta, and O. pusilla, are found from the East Coast south into the Caribbean and the Bahamas. Additionally, the eastern prickly pear is native to the midwestern "sand prairies" near major river systems, such as the Mississippi, Illinois, and Ohio rivers. The plant also occurs naturally in hilly areas of southern Illinois, and sandy or rocky areas of northern Illinois.

Opuntia species are the most cold-tolerant of the lowland cacti, extending into western and southern Canada. One subspecies, O. fragilis var. fragilis, has been found growing along the Beatton River in north-eastern British Columbia, southwest of Cecil Lake at 56° 17′ N latitude and 120° 39′ W longitude. Others are seen in the Kleskun Hills Natural Area of north-west Alberta at 55° 15′ 30″ N latitude and 118° 30′ 36″ W longitude.

Prickly pears produce a fruit known as tuna, commonly eaten in Mexico and in the Mediterranean region, which is also used to make aguas frescas. The fruit can be red, wine-red, green, or yellow-orange. In the Galápagos Islands, the Galápagos prickly pear, O. galapageia, has previously been treated as a number of different species, but is now only divided into varieties and subvarieties. Most of these are confined to one or a few islands, so they have been described as "an excellent example of adaptive radiation". On the whole, islands with tall, trunked varieties are also the home of giant tortoises, whereas islands lacking tortoises have low or prostrate forms of Opuntia.

Prickly pears are a prime source of food for the common giant tortoises in the Galápagos Islands, so they are important in the food web.

Charles Darwin was the first to note that the cacti have thigmotactic anthers. When the anthers are touched, they curl over, depositing their pollen on the pollinator. That movement can be seen by gently poking the anthers of an open Opuntia flower. The same trait has evolved convergently in other genera (e.g. Lophophora).

Natural distribution of the plant occurs via consumption and associated seed dispersal by many animals, including antelopes, nonhuman primates, elephants, birds, and humans. When ingested by elephants, the sharp components of the plant cause harm to the mouth, stomach, and intestines.

Prickly pears (mostly O. stricta) were originally imported into Europe during the 16th century. They are now found in the Mediterranean region of Northern Africa, especially in Algeria, Morocco and Tunisia, where they grow all over the countryside, and in parts of Southern Europe, especially Spain, where they can be found in the east, south-east, and south of the country, and also in Malta, where they grow all over the islands, and in southern Italy, especially in Sicily and Sardinia. They can be found in enormous numbers in parts of South Africa, where they were introduced from South America.

The prickly pear is considered an invasive species in Australia, Ethiopia, South Africa, and Hawaii, among other locations.

The first introduction of prickly pears into Australia is ascribed to the founding governor of the New South Wales colony, Arthur Phillip, and the earliest European colonists, in 1788. Brought from Brazil to Sydney, they were most likely O. monacantha. That variety did not spread beyond the east coast. However, a number of other types of prickly pear were introduced to Australian gardens in the mid-19th century. The cactus was also used as agricultural fencing and a feedstock for animals in times of drought, as well as in an attempt to establish a cochineal dye industry.

The cactus became a widespread invasive weed in the dry interior climate west of the Great Dividing Range, in New South Wales and Queensland, eventually converting 260,000 square kilometres (101,000 mi²) of farming land into an impenetrable green jungle of prickly pears in places 6 m (20 ft) high. Scores of farmers were driven off their land by what they called the "green hell", and their abandoned homes were crushed under the cactus growth, which advanced at a rate of 400,000 hectares (1 million acres) per year.

In 1919, the Australian federal government established the Commonwealth Prickly Pear Board to coordinate efforts with state governments to eradicate the weed. Early attempts, comprising mechanical removal and poisonous chemicals failed. As a last resort, biological control was attempted. In 1925, the Cactoblastis cactorum moth was introduced from South America, and its larvae rapidly began to control the infestation. Alan Dodd, the son of the noted entomologist Frederick Parkhurst Dodd, was a leading official in combating the prickly pear. A memorial hall in Boonarga, Queensland, commemorates the efforts of the moth. The release of cochineal insects, which eat the cactus and simultaneously kill the plant, has also proven an effective measure for combating its spread.

In South Africa, many species of Opuntia are considered highly invasive including O. aurantiaca, O. elata, O. engelmannii, O. ficus-indica, O. humifusa, O. leucotricha, O. microdasys, O. monacantha, O. pubescens, O. robusta, O. salmiana, O. spinulifera, O. stricta and O. tomentosa. These species are classified as Category 1 invaders, and targeted for national eradication; most activities with regards to the species are prohibited (such as importing, propagating, introducing, translocating or trading). It was also found that invasive Opuntia species have adverse effects on the beetle population in the Kruger National Park, and widespread invasions alter soil characteristics.

The fruit of prickly pears, commonly called cactus fruit, cactus fig, Indian fig (meaning "Native American", not "of India"), nopales or tuna in Spanish, is edible, although it must be peeled carefully to remove the small spines on the outer skin before consumption. If the outer layer is not properly removed, glochids can be ingested, causing discomfort of the throat, lips, and tongue, as the small spines are easily lodged in the skin. Native Americans like the Tequesta would roll the fruit around in a suitable medium (e.g. grit) to "sand" off the glochids. Alternatively, rotating the fruit in the flame of a campfire or torch has been used to remove the glochids. Today, parthenocarpic (seedless) cultivars are also available. The seeds can be used for flour.

In Mexico, prickly pears are often used to make appetizers, soups, salads, entrees, vegetable dishes, breads, desserts, beverages, candy, jelly, and drinks. The young stem segments, usually called pads or nopales, are also edible in most species of Opuntia. They are commonly used in Mexican cuisine in dishes such as huevos con nopales (eggs with nopal), or tacos de nopales. Nopales are also an important ingredient in New Mexican cuisine. In 2009 it was introduced as a cheaper alternative to corn for the production of tortillas and other corn products. They can also be pickled.

Opuntia ficus-indica has been introduced to Europe, and flourishes in areas with a suitable climate, such as the south of France and southern Italy:

Olive trees are seen as being a major component of traditional Palestinian farming life, with several generations of families gathering together to harvest the olives for two months from mid-September. The harvest season is often associated with celebration for these families, and family and local community celebrations are organised with traditional Palestinian folk music and dancing. Anthropologist Anne Meneley describes her olive-picking experience as community oriented:

We are hot and dusty and sometimes clumsy as we negotiate the rough rocks that surround the olive trees. Our Palestinian hosts bring us most welcome cool water and juice and hot sweet tea and coffee. There is communitas of sorts in this shared labor: we feel that we are contributing something, however symbolic, to the Palestinian cause.

As olive cultivation is a significant aspect of Palestinian culture, the uprooting of olive trees by Israeli settlers is a prominent point of concern in Palestinian culture. Poet Mourid Barghouti describes olive trees as "the identity card that doesn't need stamps or photos and whose validity doesn't expire with the death of the owner" and "with each olive tree uprooted by Israeli bulldozers, a family tree of Palestinian peasants falls from the wall."

Religiously, "the Holy Books refer more often to the vine and the olive tree" than to prophets. Muslim teaching also holds olives in high regard as "the Almighty is even believed to have himself taken an oath by the olive tree."

More recently, the olive tree is a symbol of rootedness. After the Israel Defense Forces defeated the Palestine Liberation Organization in the 1982 Lebanon War, the olive became a symbol for Palestinian identity. Because "olive trees are a prominent feature of the mountainous region of the landscape in the West Bank," Palestinians began to "draw connections between their ancient presence in Palestine and that of the ancient olive tree rooted in the land of Palestine."

Olive trees also have a nationalist connotation in Palestinian culture. In a speech to the United Nations General Assembly in 1974, Yasser Arafat stated that Zionist terrorism targeted the olive tree because it "has been a proud symbol" and "living reminder that the land is Palestinian." He concluded the speech with a nationalist reference to the olive branch:

Today I have come bearing an olive branch and a freedom-fighter's gun. Do not let the olive branch fall from my hand. I repeat: do not let the olive branch fall from my hand.

Arafat's remarks on the olive branch still influence literature today in works such as Raja Shehadeh's "Diary of an Internal Exile: Three Entries" in which she writes about her struggles as a resident of the West Bank. She concludes, "Arafat was right to hold a gun in one hand and an olive branch in the other. I was never so naive as to expect that Israel could be won over by the olive branch alone, but the gun could only ever be a means to an end."

In October 2021, settlers vandalized 8,000 trees in the West Bank. In the first two weeks of the 2021 harvest, 18 incidents of damage to Palestinian olive groves, consisting of acts of battering or chopping down trees or denuding their fruits were reported.

In the 2023 olive harvest season, Yesh Din reported 113 attacks by Israeli settlers and soldiers in the West Bank that disrupted olive harvest. The attacks caused 96,000 dunams of olive-planted land to go unharvested last year, resulting in approximately US$10,000,000 in losses. Approximately 1,340 olive trees were slashed by settlers in Qaryut in 2024. Over 150 attacks on olive pickers have been recorded in the 2025 olive harvest season.

Opuntia Book 8 pt

Olive trees are seen as being a major component of traditional Palestinian farming life, with several generations of families gathering together to harvest the olives for two months from mid-September. The harvest season is often associated with celebration for these families, and family and local community celebrations are organised with traditional Palestinian folk music and dancing. Anthropologist Anne Meneley describes her olive-picking experience as community oriented:

We are hot and dusty and sometimes clumsy as we negotiate the rough rocks that surround the olive trees. Our Palestinian hosts bring us most welcome cool water and juice and hot sweet tea and coffee. There is communitas of sorts in this shared labor: we feel that we are contributing something, however symbolic, to the Palestinian cause.

As olive cultivation is a significant aspect of Palestinian culture, the uprooting of olive trees by Israeli settlers is a prominent point of concern in Palestinian culture. Poet Mourid Barghouti describes olive trees as "the identity card that doesn't need stamps or photos and whose validity doesn't expire with the death of the owner" and "with each olive tree uprooted by Israeli bulldozers, a family tree of Palestinian peasants falls from the wall."

Religiously, "the Holy Books refer more often to the vine and the olive tree" than to prophets. Muslim teaching also holds olives in high regard as "the Almighty is even believed to have himself taken an oath by the olive tree."

More recently, the olive tree is a symbol of rootedness. After the Israel Defense Forces defeated the Palestine Liberation Organization in the 1982 Lebanon War, the olive became a symbol for Palestinian identity. Because "olive trees are a prominent feature of the mountainous region of the landscape in the West Bank," Palestinians began to "draw connections between their ancient presence in Palestine and that of the ancient olive tree rooted in the land of Palestine."

Olive trees also have a nationalist connotation in Palestinian culture. In a speech to the United Nations General Assembly in 1974, Yasser Arafat stated that Zionist terrorism targeted the olive tree because it "has been a proud symbol" and "living reminder that the land is Palestinian." He concluded the

In a speech to the United Nations General Assembly in 1974, Yasser Arafat stated that Zionist terrorism targeted the olive tree because it "has been a proud symbol" and "living reminder that the land is Palestinian." He concluded the speech with a nationalist reference to the olive branch:

Today I have come bearing an olive branch and a freedom-fighter's gun. Do not let the olive branch fall from my hand. I repeat: do not let the olive branch fall from my hand.

Arafat's remarks on the olive branch still influence literature today in works such as Raja Shehadeh's "Diary of an Internal Exile: Three Entries" in which she writes about her struggles as a resident of the West Bank. She concludes, "Arafat was right to hold a gun in one hand and an olive branch in the other. I was never so naive as to expect that Israel could be won over by the olive branch alone, but the gun could only ever be a means to an end."

In October 2021, settlers vandalized 8,000 trees in the West Bank. In the first two weeks of the 2021 harvest, 18 incidents of damage to Palestinian olive groves, consisting of acts of battering or chopping down trees or denuding their fruits were reported.

In the 2023 olive harvest season, Yesh Din reported 113 attacks by Israeli settlers and soldiers in the West Bank that disrupted olive harvest. The attacks caused 96,000 dunams of olive-planted land to go unharvested last year, resulting in approximately US$10,000,000 in losses.

Desetiletý výzkum života a díla charismatické spisovatelky Heleny Frischerové byl přes nedostatek materiálu úspěšný. Suverénně zpracovaný záznam rozbíhavého a leckdy úmorného pátrání, z něhož se v próze Aleny Machoninové rodí příběh o hledání vlastního hlasu, oživuje až starosvětskou čtenářskou slast.

Hella Aleny Machoninové vyšla v nakladatelství Maraton ke konci loňského roku; stačila zaujmout výrazné pozice v různých bilančních anketách a vyjádřilo se k ní několik profesionálních kulturních debatérů. Domnívám se, že vzbudila pozornost nejen závažnými tématy a jazykem, v němž občas probleskne zvláštní cizí akcent, ale především propracovaností. Je to kniha, v níž má psané slovo zásadní vliv na lidský život; literatura je hybnou silou, záchranou, marným útěkem, způsobem odporu atd. Žití je tu v jistém smyslu pohybem od knihy ke knize. I sám způsob vyprávění je pojat jako literární postava ve vývoji. Hranice mezi fikcí, její interpretací, dokumentem a realitou se v Helle udržují s rostoucím úsilím, až se řízeně rozpadají. Hella je čtivý, avšak komplikovaný text plný citací, dokumentů a jmen, jímž lze postupovat na způsob rojnice. Mne na něm však zaujala především role samotné vypravěčky.

Vzpoury materiálu

Současná česká literární vědkyně A., překladatelka a spisovatelka ve stavu zrodu, jež žije s přestávkami posledních dvacet let v Moskvě, rekonstruuje život jiné spisovatelky, Heleny Frischerové (1906–1984). Předestírá průběh soukromého výzkumu, který divoce přerostl původní záměr. Zaznamenává proměny své fascinace touto ženou, obkružuje její životní momenty, témata, ale třeba i fotografie a nebrání se, ve vší pokoře, hledání styčných bodů s vlastním přemýšlením nikoli jen o psaní a čtení. A také se, ač se to nezdá, od své složitě budované představy o Helle odpoutává.

Po rusky a německy píšící autorce původem z Prostějova Heleně Frischerové, která prožila roky 1937 až 1947 v sovětských nápravně-pracovních táborech a další léta ve vyhnanství, nezbylo mnoho textů. V českém překladu je možno si přečíst memoárovou prózu Dny mého života. Vzpomínky na gulag (2014, česky 2017). Německy psané básně z lágru se téměř všechny ztratily. A. tedy využívá i materiály, k nimž se podle detektivně vystavěného vyprávění dostala shodou náhod i dobýváním archivů. Jde o román Jiřího Weila o každodennosti za sovětského Velkého teroru Moskva-hranice (1937), jehož hlavní hrdince byla Helena Frischerová předobrazem, a o vzpomínky Tamary Petkevičové Bolest si věk nevybírá (1993, česky 2017). Petkevičová (1920–2017) poskytla A. svou korespondenci s Hellou a její fotografické portréty, citován je též Hellin vyšetřovací spis z hrůzného roku 1937.

Poměrně chudý výzkumný materiál (většinou uměleckého rázu, tedy nespolehlivý) doplňovaný pátráním na místech Hellina života, v archivech, matrikách či seznamech obětí totalitních režimů se opakovaně vzpírá až úřednické touze po úplnosti a přesnosti, jíž A. místy sebeironicky glosuje. Materiál odmítá uspokojit zvědavost tazatelky a zároveň deformuje a zpochybňuje její otázky.

Cizí slova, moje slova

Prázdno mezi historickými fakty včetně přípustných dohadů badatelce pod rukama zarůstá fragmenty návazných textů: cizích esejů, básní, próz. Odkazují jeden k druhému, týkají se lágrové literatury, terapeutických možností psaní i šálivosti vlastní paměti nebo fotografií, zmiňován je podíl jazyka protokolů či udání na našem poznávání minulosti.

Výběr, propojování, interpretace a někdy třeba i rytmizování a opakování cizích textů je vypravěččin základní vyjadřovací prostředek. Mezi citáty však nenápadně vyvstává i její vlastní hlas. Jako by, pronásledována útržky přečtených, překládaných a opisovaných veršů a vět, ohledávala možnosti vlastního psaní. Jako by se chtěla vypořádat s vlastní čtenářskou citlivostí. Například variuje stručný Hellin životopis v sekaných větách, sampluje verše raných ruských konceptualistů Jana Satunovského, Vsevoloda Někrasova nebo Igora Cholina, podkresluje text neartikulovanými zvuky. Při popisech kombinuje „nájezdy kamerou“, při změnách časoprostorů (byt zemřelé profesorky, Moskva Jiřího Weila nebo Andreje Platonova, protiputinovská demonstrace v roce 2012) energicky mění žánry a perspektivy, nostalgický popis střídá reportérský styl. A třeba protokol z výslechu Heleny Frischerové je v podstatě komentovaná inscenace. Chvíle literárněhistorické i tvůrčí nejistoty A. zpřítomňuje a zahání prostým přepisováním a popisováním Helliny korespondence. Opisování a překlady textů (jako pokusy o co největší přiblížení) sama nazve únikem od vlastního psaní.

Přímé citace, ale i ohledávání cizích rytmů a strategií jsou snahou pochopit, z čeho vyrůstá „to moje“. Ostatně už počáteční odstavec knihy je směsí vlastních
